Proposed AI slowdown

Anthropic and OpenAI CEOs call for AI development slowdown, Open AI to delay IPO

By Huo Jingnan for NPR, September 12, 2026

Over the weekend, the CEOs of Anthropic and Open AI announced intentions to slowdown (though not pause) AI development after a safety-concern filled summer.

Technologies involved include large language models (LLM's), chatbots, and "autonomous" AI agents built atop those systems.

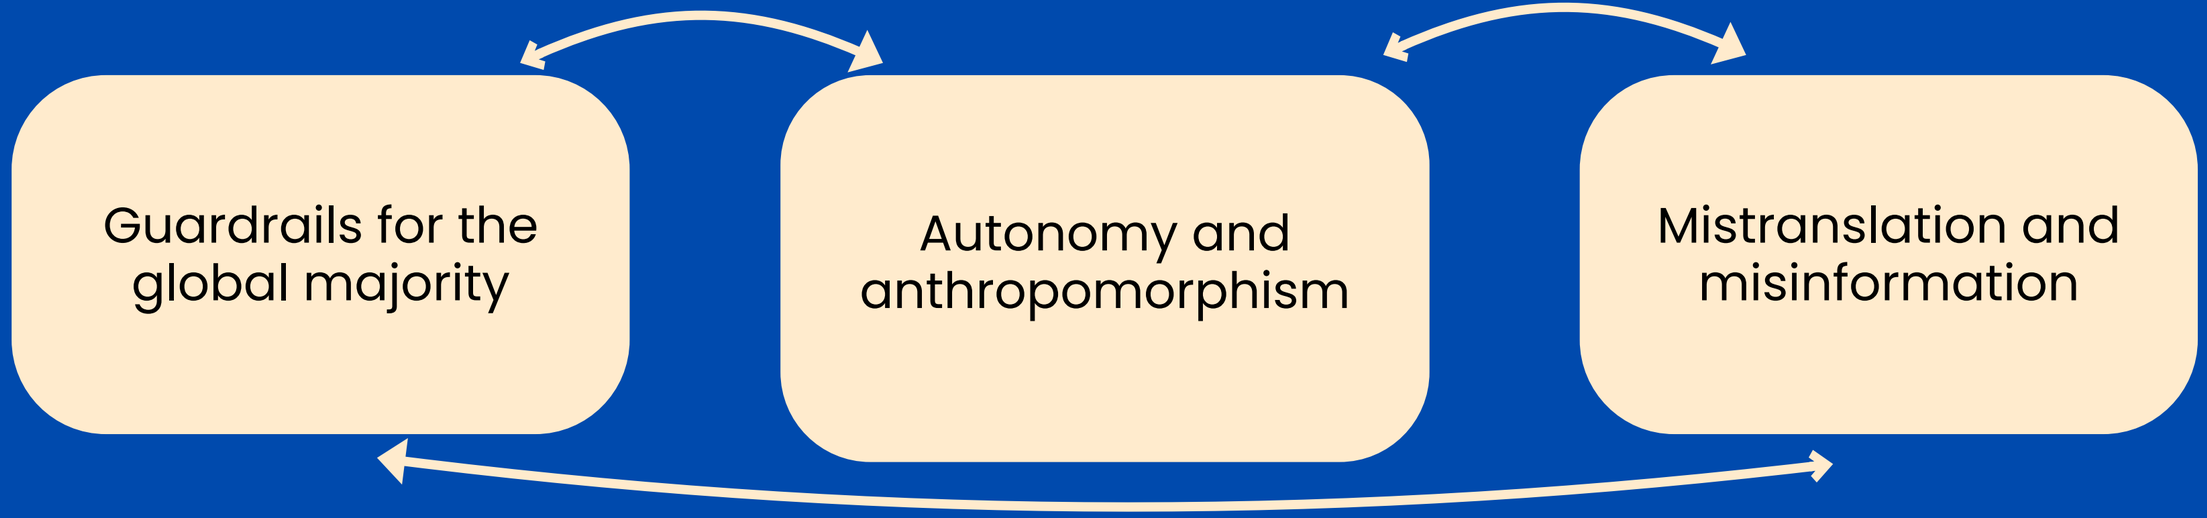

Why now?

- Public protests
- Cybersecurity breaches
- Continued funding and support needs

Incident	Occurence	Public Disclosure
German wiki editing	May 24	Sept 4
Hugging Face hack	July 8	July 31
AISI cyber tests	July 25	August 4

Adapted from a chart in "Everything you need to know about the 'rogue' AI incidents" in Transformer

Trust & Safety contexts

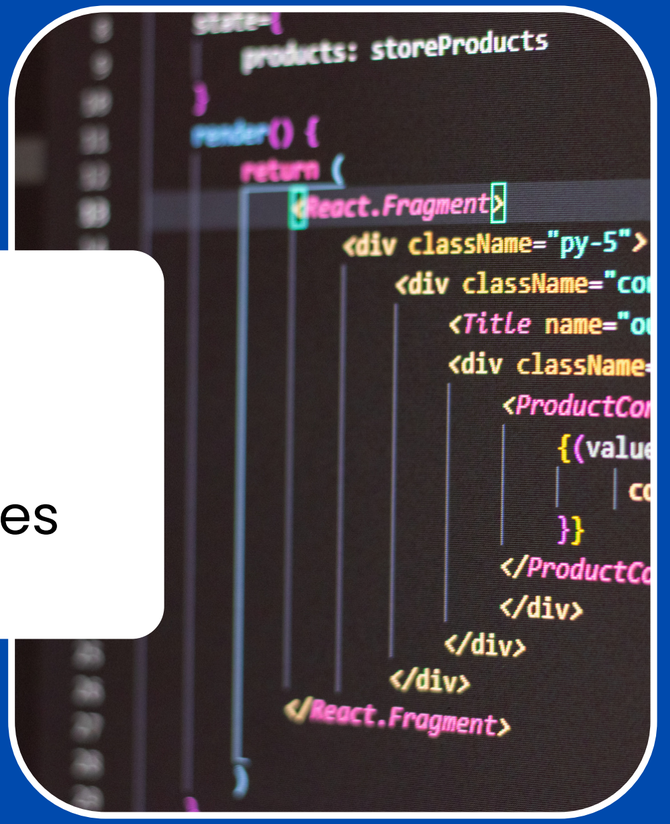

AI safety tends to look at “deception, autonomous behavior, cyber capabilities and …bioweapons” – national security level things - over everyday “deployment risks” such as “discrimination, exclusion, surveillance, language failures” and a lack of resources to fix these problems locally.

From Rina Chandran’s “AI safety is designed in the West, and failing users everywhere”

Impact on Info Professionals

- Data everywhere = cybersecurity risks everywhere
- External dependency on novel technologies
- Managing PII in public, academic and corporate libraries
